CONSULTANTS

April 16, 1992

Taco Bell Corporation
2303 W. Meadowview Road, Suite 46
Greensboro, NC 27407

Attention: Mr. James N. Koutris
Construction Manager

Subject: Report of Excavation Monitoring, Soil Disposal and
Preliminary Ground-Water Assessment
Proposed Taco Bell Site
3742 Battleground Avenue
Greensboro, North Carolina
Law Job No. 259-00194-02

Dear Mr. Koutris:

As authorized by your acceptance of our Proposal No. PGB-101E2, Law Engineering has completed the excavation monitoring and disposal of petroleum hydrocarbon-containing soil, and preliminary ground-water assessment at the subject site. Included in this report is a description of the activities performed, the results obtained and our conclusions and recommendations.

Law Engineering appreciates the opportunity to serve as your environmental consultant on this project. We will contact you in three days to see if you have any questions concerning this report.

Sincerely,

LAW ENGINEERING

Joseph P. Best
Staff Geologist

James D. Rudder, Jr., P.G.
Principal Geologist

1.0 PROJECT INFORMATION

The subject site is located at 3742 Battleground Avenue, in Greensboro, North Carolina. Richardson Turner Construction Company (RTC) has been contracted by Taco Bell to construct a Taco Bell restaurant on the site. During construction of an on-site retention pond, three underground storage tanks (USTs) were discovered. These USTs were subsequently removed from their original locations by a subcontractor to RTC.

Taco Bell Corporation retained Barrow Backhoe Company to dispose of the USTs, excavate petroleum hydrocarbon-containing soil associated with the USTs, and temporarily stockpile the excavated soil on site. Taco Bell contracted Law Engineering to monitor the excavation activities, perform soil sampling, and perform a preliminary ground-water assessment.

The above project information was obtained from telephone conversations between Mr. Cary Ratliff of RTC and Mr. Joseph Best of Law Engineering, and from field observations made by Mr. Best.

2.0 CONTRACTED SCOPE OF SERVICES

Law Engineering contracted with Taco Bell to perform the two scopes of service. These scopes are described below:

2.1 Excavation Monitoring and Soil Remediation

- o Monitor the excavation of petroleum hydrocarbon containing soil associated with three former underground storage tanks (USTs). Excavation activities would be terminated when soils containing TPH concentrations exceeding 10 parts per million (ppm) were removed. Excavation, stockpiling, loading and transportation of soil would be performed by Barrow Backhoe Company in accordance with their proposal to Taco Bell dated March 11, 1992.
- o Collect confirmation soil samples from the floor and walls of the excavation at the completion of excavation activities.
- o Collect two composite soil samples from the soil excavated during construction of the retention pond.
- o Collect one duplicate sample daily for quality control purposes.

- o The confirmation samples would be shipped via overnight express delivery to Law Environmental National Laboratories (LENL) in Kennesaw, Georgia to be analyzed for volatile and semi-volatile total petroleum hydrocarbons (TPH) using EPA Methods 5030 with flame ionization detection (FID) and 3550 with FID, respectively.
- o Collect one composite soil sample representative of the petroleum hydrocarbon-containing material excavated at the site. The representative sample would be labeled, appropriately preserved and shipped by overnight delivery to the laboratory for analysis for those parameters necessary for acceptance by a thermal treatment facility (volatile and semi-volatile priority pollutants - EPA Method 8240 and 8270, polychlorinated biphenyls - EPA Method 8080, and metals by TCLP).
- o Law Engineering would contract with a licensed thermal treatment facility to treat the petroleum hydrocarbon-containing soil presently stockpiled on site. Each truckload of material would be manifested, and a certificate of receipt and treatment would be obtained from the treatment facility.

2.2 Preliminary Ground-Water Assessment

- o Install one two-inch diameter schedule 40 PVC temporary monitoring well in close proximity to the former locations of the USTs. This well would be constructed with 15 feet of slotted PVC screen (0.01-inch slot widths) installed to intersect the elevation of the water table at the time of drilling. During drilling of unconsolidated subsurface material we would perform soil sampling and penetration testing in general accordance with ASTM 1586.
- o Develop, purge and sample the well. The collected samples would be labeled, appropriately preserved and shipped by overnight delivery to LENL. LENL would analyze the samples collected from the monitoring well for BTEX (benzene, toluene, ethylbenzene and xylenes using EPA Method 602 including xylenes) and semi-volatile organic priority pollutants (EPA Method 625). We would collect one duplicate sample for quality control purposes.
- o NCDEHNR regulations require a permit prior to installing any ground-water monitoring well. Prior to monitoring well installation we would prepare and submit a monitoring well permit application.

2.3 Report

- o Prepare a written report describing our field activities, the results obtained, and our conclusions and recommendations.

3.0 SITE CONDITIONS

The site is currently being prepared for the construction of a Taco Bell Restaurant. The former convenience store/gas station has been demolished and the site cleared. The site slopes to the west and is located approximately 1,000 feet south of Horsepen Creek.

4.0 EXCAVATION ACTIVITIES

4.1 Excavation

Excavation was performed by Barrow Backhoe of Greensboro, North Carolina, using a trackhoe. A total of approximately 350 tons of soil were excavated on March 3, 1992. Excavation continued until visual and olfactory observation indicated soil containing petroleum hydrocarbons had been removed. Samples were then collected to confirm this observation.

Following the receipt of laboratory analytical results which identified TPH concentrations in the west sidewall, east sidewall and floor of the excavation, additional excavation was conducted in these locations. On March 23, 1992 a total of approximately 150 additional tons of soil were excavated. Excavation activities were terminated when visual and olfactory observation indicated soil containing petroleum hydrocarbons had been removed. Confirmation samples were then collected.

Excavated soil was temporarily stockpiled on site. The soil was placed on three layers of 10 mil plastic and covered with plastic prior to transportation to the treatment facility.

During excavation activities we encountered fill material consisting of orange clayey fine sandy silt to a depth of approximately six inches below the bottom of the retention pond. Below the fill we encountered residual material consisting of blue to gray coarse to medium sandy silt (saprolite). Moist soil conditions were encountered as the excavation activities were terminated.

4.2 Soil Sample Collection

On March 3, 1991 ten representative soil samples and one duplicate sample were collected from floor and sidewalls of the excavation (Figure 2). On March 23, 1992 four soil samples and one duplicate sample were collected from the expanded excavation.

Each soil sample to be analyzed in the laboratory was manually collected from the bucket of the on-site trackhoe using a new, disposable vinyl glove. After collection, the sample was placed into one two-ounce and one four-ounce capacity laboratory-prepared glass container equipped with a teflon-lined screw cap. The sample containers were filled completely to minimize headspace.

The filled sample containers were labeled to indicate the sample location, date, time, and presence or absence of preservatives. The sample containers were then placed into one-quart capacity zip-lock baggies. The baggies containing the samples were placed in a cooler containing ice and shipped to LENL for analysis for volatile and semi-volatile TPH. Appropriate chain of custody was maintained, as documented in the Appendix.

5.0 RESULTS OF LABORATORY ANALYSES

The soil samples were analyzed for volatile (EPA method 5030-FID) and semi-volatile TPH (EPA method 3550-FID). Laboratory analytical results are summarized on Table 1, and laboratory data sheets are contained in the Appendix.

Laboratory analyses of confirmation soil samples collected on March 3, 1992 detected the following semi-volatile TPH concentrations (Table 1): 73 ppm (west wall sample), 18 ppm (east wall sample), 14 ppm (F-2 floor sample), 12 ppm (F-2 duplicate floor sample), 12 ppm (F-3 floor sample), 21 ppm (F-4 floor sample), and 130 ppm (F-5 floor sample). Samples collected from the north wall, the south wall and two floor samples (F-1 and F-6) did not contain detectable concentrations of semi-volatile TPH. No concentrations of volatile TPH were detected.

Based on the detection of TPH concentrations in the west and east sidewalls and floor of the excavation, the excavation was expanded in these directions. Laboratory analyses of confirmation soil samples collected on March 26, 1992 at the completion of excavation activities did not detect volatile or semi-volatile TPH concentrations. The practical quantification limits for the volatile and semi-volatile TPH analyses were 5 ppm and 10 ppm, respectively.

6.0 SOIL DISPOSAL

Barrow Backhoe was retained by Taco Bell to load and transport petroleum hydrocarbon-containing soil stockpiled during the excavation activities described above. Additionally, approximately 900 tons of soil excavated during construction of the retention pond were also removed from the site.

Law Engineering contracted with Cunningham Brick Company of Thomasville, North Carolina to thermally treat the petroleum hydrocarbon-containing soil. Each truckload of material was weighed and manifested. A certificate of receipt was issued by Cunningham Brick Company.

7.0 GROUND-WATER ASSESSMENT

Because of the shallow depth to ground water, assessment of the ground water was performed as described below.

7.1 Soil Borings

Law Engineering personnel drilled one soil boring to a depth of 11 feet below grade (Figure 2). The boring was drilled using truck-mounted drilling equipment which included 10-inch O.D. (6.25-inch I.D.) hollow stem augers. To prevent cross contamination, the downhole drilling equipment was steam cleaned prior to commencing activities at the boring location.

Soil samples were collected from the boring at depths of 3.5 to 5 feet and 8.5 to 10 feet below the ground surface. The samples were collected using an 18-inch long split-spoon sampler having an inside diameter of 1.75-inches. The soil sampling methodology was performed in general accordance with ASTM D-1586. Representative samples were classified in the field by Law Engineering's on-site field geologist. A soil Test Boring Record was completed and is contained in the Appendix.

The split-spoon sampler was decontaminated prior to each use utilizing the following procedure:

- o Rinsing with potable (tap)water
- o Washing in an Alconox-potable water solution
- o Rinsing with potable water
- o Rinsing with Reagent-grade isopropyl alcohol
- o Rinsing with distilled water

7.2 Subsurface Conditions

During our drilling of boring MW-1 we observed residual soil consisting of brown coarse to medium sandy silt.

7.3 Monitoring Well Installation

After completion of the soil boring, the boring was converted to a temporary monitoring well with a total depth of approximately 11 feet below the ground surface. The total well depth was selected based on consideration of the depth to ground water as indicated by soil moisture conditions, auger cuttings, and observations of water within the borehole.

The Type II temporary ground-water monitoring well was constructed with 2-inch I.D. Schedule 40 PVC flush-threaded casing and screen. The PVC screen and casing were lowered through the annulus of the augers to the appropriate depth. A 10-foot slotted well screen with machined 0.01-inch slot widths was installed at the bottom of the well. The bottom of the slotted interval was sealed with a threaded plug.

The annular space around the well was filled with a washed and graded sand from the bottom of the boring to the top of the screen. A one-foot thick seal of bentonite pellets was placed immediately above the sand pack. After placement in the well, the bentonite pellets were hydrated by applying approximately ten gallons of potable (tap) water and waiting approximately 30 minutes. The general construction details for the well are shown on the Boring Log and Well Installation Diagram found in the Appendix.

The well was developed by evacuating at least five well volumes using a disposable one-liter capacity teflon bailer. The well was developed to achieve two objectives: 1) to remove sand, silt and other fine sediments which may have entered the well during its construction; and 2) to develop the sandpack surrounding the well's screened interval.

7.4 Monitoring Well Sampling

Immediately after development the well was sampled using the teflon bailer. Immediately after collection, each ground-water sample was transferred from the teflon bailer into three 40 milliliter (ml) clean, glass containers (equipped with teflon-lined screw-caps) and one liter, clean amber glass container (also equipped with a teflon-lined screw cap). New disposable vinyl gloves were utilized in the sample transfer. The sample containers were completely filled with sample to eliminate headspace.

After being filled, each sample container was labeled with the job name and number, the time and date of sample collection, the analyses to be performed, and the presence or absence of preservative. The filled 40 ml sample containers were placed into a new, one-quart capacity zip-lock baggy.

Each baggy containing filled sample containers was placed into a cooler containing ice and cooled to approximately four degrees Celsius. The chain of custody was initiated. The cooler containing the samples was shipped via overnight express delivery to LENL.

7.5 Results of Laboratory Analyses

The ground-water sample (and duplicate sample) was analyzed for semi-volatile priority pollutants (EPA Method 625) and benzene, ethylbenzene, toluene and xylenes (BTEX - EPA Method 602 and xylenes). The laboratory analytical results are summarized on Table 2, and the laboratory data sheets are contained in the Appendix.

8.0 CONCLUSIONS AND RECOMMENDATIONS

Laboratory analyses of confirmation soil samples indicate that petroleum hydrocarbon-containing soil associated with the three USTs has been removed from the site.

Ground water beneath the site contains trace concentrations of benzene. Law Engineering recommends that a copy of this report be submitted to Mr. Steve Kay of the North Carolina Department of Environment, Health, and Natural Resources (Winston-Salem Regional Office).

Mr. Kay was contacted by telephone by Mr. Jim Rudder of Law Engineering on April 3, 1992. After Mr. Rudder described the results of the site assessment to Mr. Kay, Mr. Kay felt there was no need for a future meeting, and that the results would not warrant any additional assessment. At Taco Bell's request we will submit a copy of this report to Mr. Kay.

9.0 QUALIFICATION OF REPORT

The activities and evaluative approaches used in this project are consistent with those normally employed in hydrogeological assessments and waste-management projects of this type. Our evaluation of site conditions has been based on our understanding of the site, project information and data obtained during the excavation and assessment activities performed at the Taco Bell property.
